### Advantages of AWS

Following are the pros of using AWS services:

- AWS allows organizations to use the already familiar programming models, operating systems, databases, and architectures.
- It is a cost-effective service that allows you to pay only for what you use, without any up-front or long-term commitments.
- You will not require to spend money on running and maintaining data centers.
- Offers fast deployments

- You can easily add or remove capacity.
- You are allowed cloud access quickly with limitless capacity.
- Total Cost of Ownership is very low compared to any private/dedicated servers.
- Offers Centralized Billing and management
- Offers Hybrid Capabilities
- Allows you to deploy your application in multiple regions around the world with just a few clicks

### ***Disadvantages of AWS***

- If you need more immediate or intensive assistance, you'll have to opt for paid support packages.
- Amazon Web Services may have some common cloud computing issues when you move to a cloud. For example, downtime, limited control, and backup protection.
- AWS sets default limits on resources which differ from region to region. These resources consist of images, volumes, and snapshots.
- Hardware-level changes happen to your application which may not offer the best performance and usage of your applications.

### ***Best practices of AWS***

- You need to design for failure, but nothing will fail.
- It's important to decouple all your components before using AWS services.
- You need to keep dynamic data closer to compute and static data closer to the user.
- It's important to know security and performance tradeoffs.
- Pay for computing capacity by the hourly payment method.
- Make a habit of a one-time payment for each instance you want to reserve and to receive a significant discount on the hourly charge.

### **How to Create EC2 Instance in AWS:**

#### ***What is Amazon EC2 Instance?***

An **EC2 instance** is nothing but a virtual server in Amazon [Web services](#) terminology. It stands for **Elastic Compute Cloud**. It is a web service where an AWS subscriber can request and provision a compute server in AWS cloud.

An **on-demand** EC2 instance is an offering from AWS where the subscriber/user can rent the virtual server per hour and use it to deploy his/her own applications.

The instance will be charged per hour with different rates based on the type of the instance chosen. AWS provides multiple instance types for the respective business needs of the user.

Thus, you can rent an instance based on your own CPU and memory requirements and use it as long as you want. You can terminate the instance when it's no more used and save on costs. This is the most striking advantage of an on-demand instance- you can drastically save on your CAPEX.

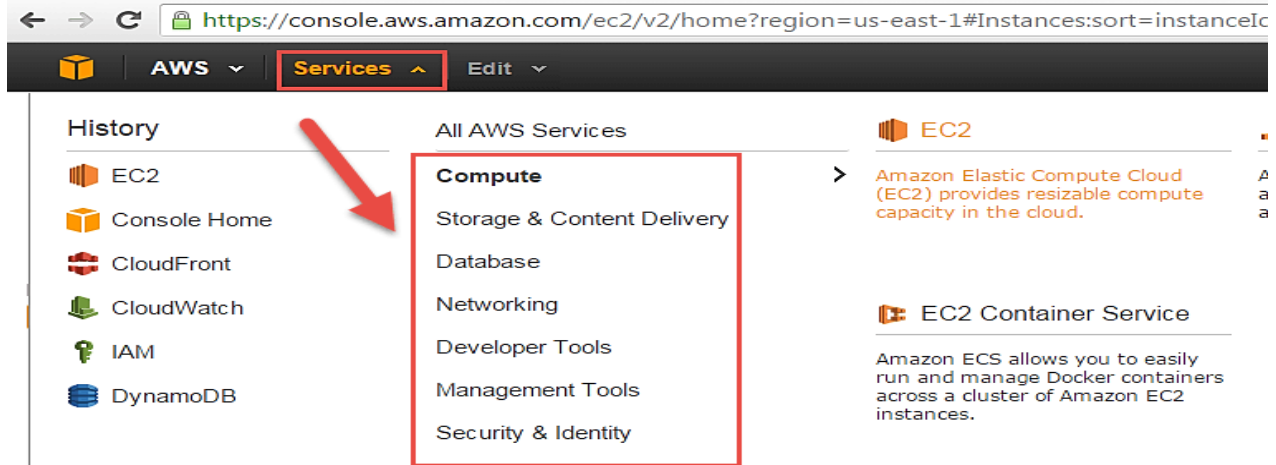

Let us see in detail how to launch an on-demand EC2 instance in AWS Cloud.

## Login and access to AWS services

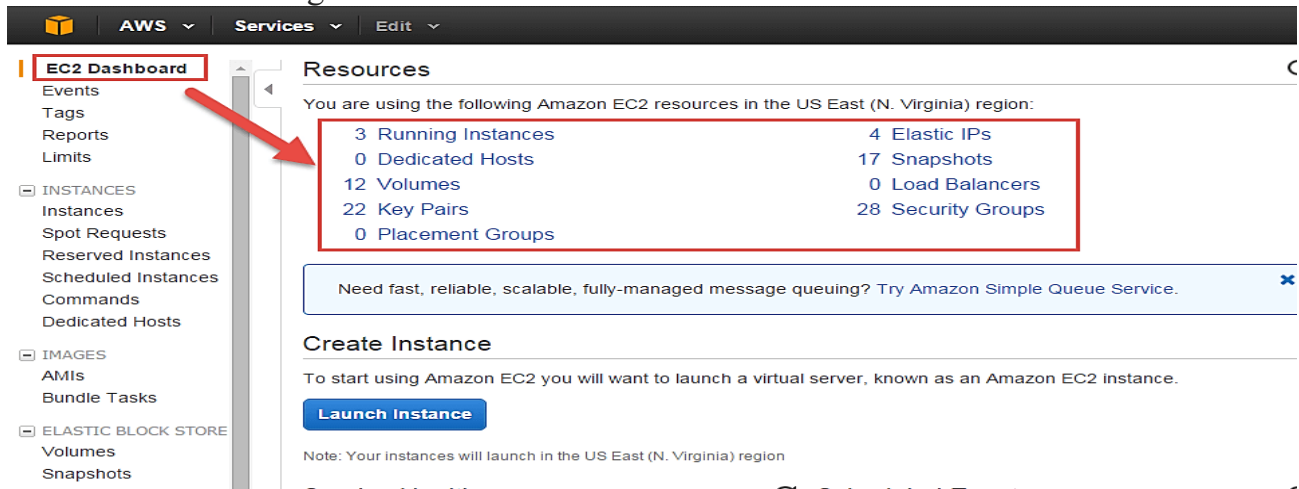

### Step 1) In this step,

- Login to your AWS account and go to the AWS Services tab at the top left corner.
- Here, you will see all of the AWS Services categorized as per their area viz. Compute, Storage, Database, etc. For creating an EC2 instance, we have to choose Compute EC2 as in the next step.

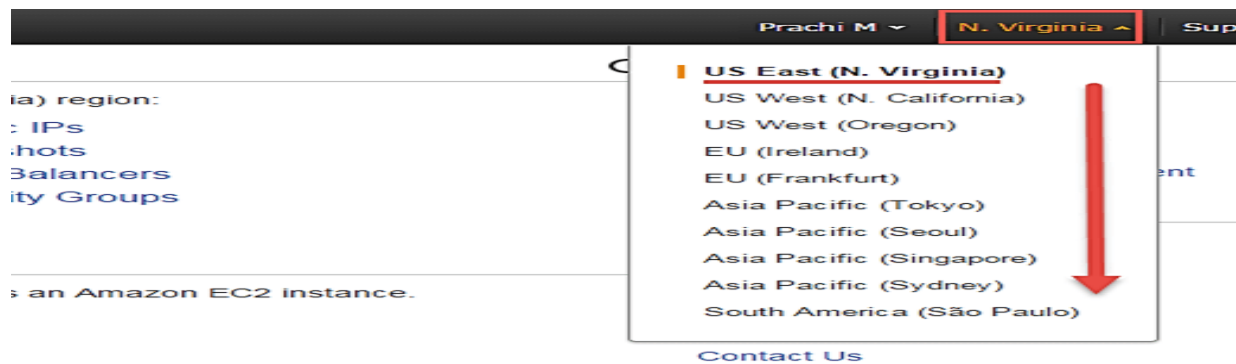

- Open all the services and click on EC2 under Compute services. This will launch the dashboard of EC2.

Here is the EC2 dashboard. Here you will get all the information in gist about the AWS EC2 resources running.

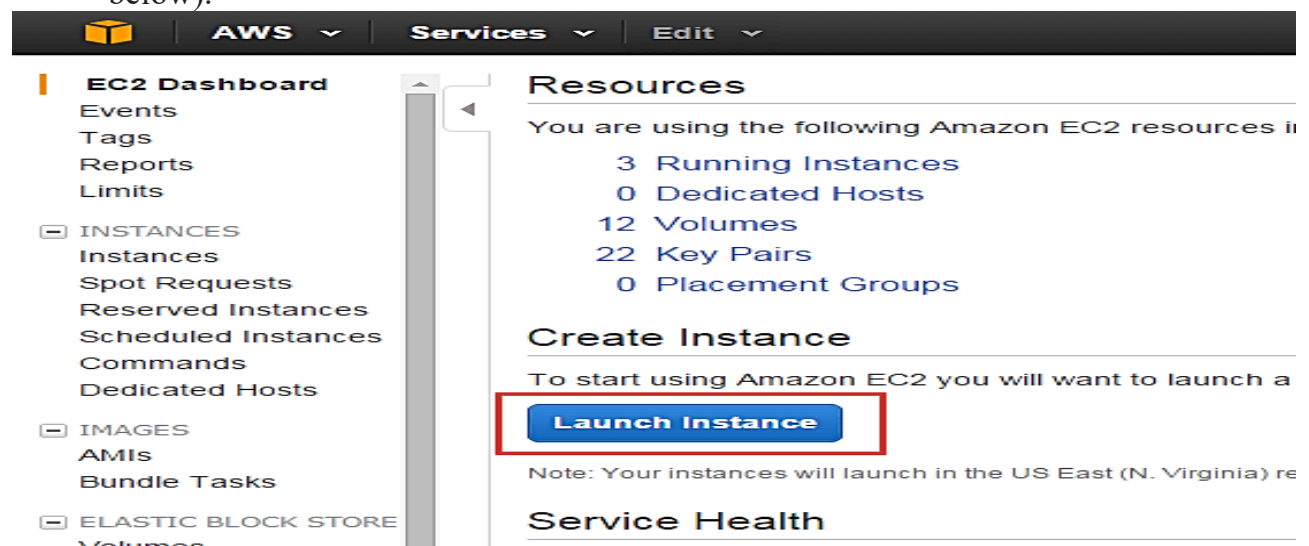

### Step 2) On the top right corner of the EC2 dashboard, choose the AWS Region in which you want to provision the EC2 server.

Here we are selecting N. Virginia. AWS provides 10 Regions all over the globe.

### Step 3) In this step

- Once your desired Region is selected, come back to the EC2 Dashboard.
- Click on 'Launch Instance' button in the section of Create Instance (as shown below).

- Instance creation wizard page will open as soon as you click 'Launch Instance'.

### Choose AMI

#### Step 1) In this step we will do,

1. You will be asked to choose an AMI of your choice. (An AMI is an Amazon Machine Image. It is a template basically of an Operating System platform which you can use as a base to create your instance). Once you launch an EC2 instance from your preferred AMI, the instance will automatically be booted with the desired OS. (We will see more about AMIs in the coming part of the tutorial).
2. Here we are choosing the default Amazon [Linux](#) (64 bit) AMI.

1. Choose AMI **1** Choose Instance Type 3. Configure Instance 4. Add Storage 5. Tag Instance 6. Configure Security Group 7. Review

### Step 1: Choose an Amazon Machine Image (AMI)

[Cancel and Exit](#)

An AMI is a template that contains the software configuration (operating system, application server, and applications) required to launch your instance. You can select an AMI provided by AWS, our user community, or the AWS Marketplace; or you can select one of your own AMIs.

**Quick Start**

- My AMIs
- AWS Marketplace
- Community AMIs

## Choose EC2 Instance Types

**Step 1)** In the next step, you have to choose the type of instance you require based on your business needs.

1. We will choose t2.micro instance type, which is a 1vCPU and 1GB memory server offered by AWS.
2. Click on "Configure Instance Details" for further configurations

**AWS Services** Edit Prachi M N. Virginia Support

1. Choose AMI **2. Choose Instance Type** 3. Configure Instance 4. Add Storage 5. Tag Instance 6. Configure Security Group 7. Review

### Step 2: Choose an Instance Type

Amazon EC2 provides a wide selection of instance types optimized to fit different use cases. Instances are virtual servers that can run applications. They have varying combinations of CPU, memory, storage, and networking capacity, and give you the flexibility to choose the appropriate mix of resources for your applications. [Cancel](#) [Previous](#) [Review and Launch](#)

- In the next step of the wizard, enter details like no. of instances you want to launch at a time.
- Here we are launching one instance.

### Configure Instance

**Step 1)** No. of instances- you can provision up to 20 instances at a time. Here we are launching one instance.

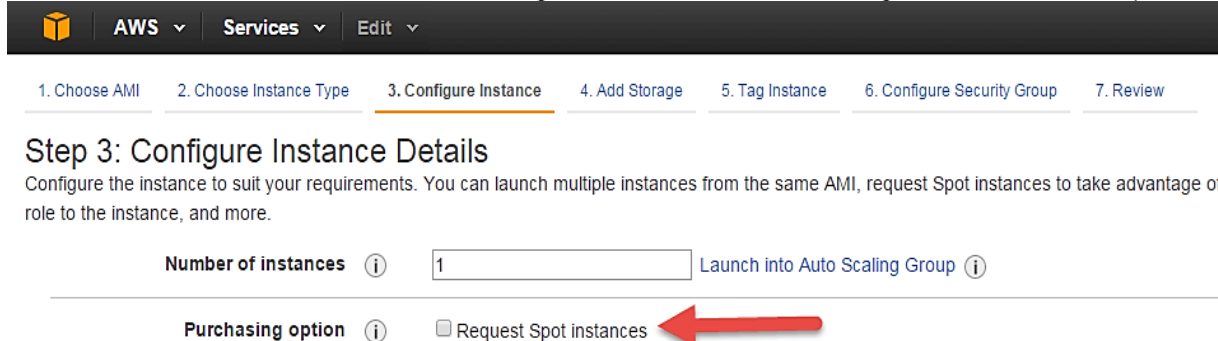

The screenshot shows the AWS console interface for configuring an instance. The top navigation bar includes 'AWS', 'Services', and 'Edit'. Below the navigation bar, there are seven steps: 1. Choose AMI, 2. Choose Instance Type, 3. Configure Instance (highlighted), 4. Add Storage, 5. Tag Instance, 6. Configure Security Group, and 7. Review. The 'Configure Instance' step is active, and the 'Number of instances' field is set to 1. A red arrow points to this field.

### Step 3: Configure Instance Details

Configure the instance to suit your requirements. You can launch multiple instances from the same AMI, request Spot instances to take advantage of role to the instance, and more.

**Step 2)** Under Purchasing Options, keep the option of 'Request Spot Instances' unchecked as of now. (This is done when we wish to launch Spot instances instead of on-demand ones. We will come back to Spot instances in the later part of the tutorial).

The screenshot shows the AWS console interface for configuring an instance. The top navigation bar includes 'AWS', 'Services', and 'Edit'. Below the navigation bar, there are seven steps: 1. ### Step 3: Configure Instance Details

Configure the instance to suit your requirements. You can launch multiple instances from the same AMI, request Spot instances to take advantage of role to the instance, and more.

**Step 3)** Next, we have to configure some basic networking details for our EC2 server.

- You have to decide here, in which VPC (Virtual Private Cloud) you want to launch your instance and under which subnets inside your VPC. It is better to determine and plan this prior to launching the instance. Your AWS architecture set-up should include IP ranges for your subnets etc. pre-planned for better management. (We will see how to create a new VPC in Networking section of the tutorial).
- Subnetting should also be pre-planned. E.g.: If it's a web server you should place it in the public subnet and if it's a DB server, you should place it in a private subnet all inside your VPC.

Below,

1. Network section will give a list of VPCs available in our platform.
2. Select an already existing VPC
3. You can also create a new VPC

Here I have selected an already existing VPC where I want to launch my instance.

**Step 3: Configure Instance Details**  
Configure the instance to suit your requirements. You can launch multiple instances from the same AMI, request Spot instances to take advantage of the role to the instance, and more.

 vpc-4c51bf28 (10.0.0.0/16) | POC\_vpc3

**Step 4)** In this step,

- A VPC consists of subnets, which are IP ranges that are separated for restricting access.
- Below,
  1. Under Subnets, you can choose the subnet where you want to place your instance.
  2. I have chosen an already existing public subnet.
  3. You can also create a new subnet in this step.

**Step 3: Configure Instance Details**  
Configure the instance to suit your requirements. You can launch multiple instances from the same AMI, request Spot instances to take advantage of the role to the instance, and more.

 subnet-b3e3d0ea(192.168.2.0/24) | Prachi\_Test-Public subnet2 | us-east-1b

- Once your instance is launched in a public subnet, AWS will assign a dynamic public IP to it from their pool of IPs.

**Step 5)** In this step,

- You can choose if you want AWS to assign it an IP automatically, or you want to do it manually later. You can enable/ disable 'Auto assign Public IP' feature here likewise.

- Here we are going to assign this instance a static IP called as EIP (Elastic IP) later. So we keep this feature disabled as of now.

**Step 3: Configure Instance Details**

## Add Storage

**Step 1)** In this step we do following things,

- In the Add Storage step, you'll see that the instance has been automatically provisioned a General Purpose SSD root volume of 8GB. ( Maximum volume size we can give to a General Purpose volume is 16GB)
- You can change your volume size, add new volumes, change the volume type, etc.
- AWS provides 3 types of EBS volumes- Magnetic, General Purpose SSD, Provisioned IOPS. You can choose a volume type based on your application's IOPs needs.

**Step 4: Add Storage**

Your instance will be launched with the following storage device settings. You can attach additional EBS volumes and instance store volumes to your instance, or edit the settings of the root volume. You can also attach additional EBS volumes after launching an instance, but not instance store volumes. [Learn more about storage options in Amazon EC2.](#)

Volume Type	Device	Snapshot	Size (GiB)	Volume Type	IOPS	Delete on Termination	Encrypted
Root	/dev/xvda	snap-a17f1036	8	General Purpose SSD (GP2)	24 / 3000	<input checked="" type="checkbox"/>	Not Encrypted

[Add New Volume](#)

Free tier eligible customers can get up to 30 GB of EBS General Purpose (SSD) or Magnetic storage. [Learn more about free usage tier eligibility and usage restrictions.](#)

**Step 5: Tag Instance**

A tag consists of a case-sensitive key-value pair. For example, you could define a tag with key = Name and value = Webserver. [Learn more about tagging your Amazon EC2 resources.](#)

Key (127 characters maximum)	Value (255 characters maximum)
Name	Dev_Web Server 01

[Create Tag](#) (Up to 10 tags maximum)

## Tag Instance

### Step 1) In this step

- you can tag your instance with a key-value pair. This gives visibility to the AWS account administrator when there are lot number of instances.
  - The instances should be tagged based on their department, environment like Dev/SIT/Prod. Etc. this gives a clear view of the costing on the instances under one common tag.
1. Here we have tagged the instance as a **Dev\_Web server 01**
  2. Go to configure Security Groups later

## Configure Security Groups

**Step 1)** In this next step of configuring Security Groups, you can restrict traffic on your instance ports. This is an added firewall mechanism provided by AWS apart from your instance's OS firewall.

You can define open ports and IPs.

- Since our server is a webserver, we will do following things
1. Creating a new Security Group
  2. Naming our SG for easier reference
  3. Defining protocols which we want enabled on my instance
  4. Assigning IPs which are allowed to access our instance on the said protocols
  5. Once, the firewall rules are set- Review and launch

The screenshot shows the AWS Management Console interface for configuring a security group. At the top, there's a navigation bar with 'AWS', 'Services', and 'Edit' buttons. Below it, a progress bar shows steps from '1. Choose AMI' to '7. Review', with '6. Configure Security Group' being the active step. The main heading is 'Step 6: Configure Security Group'. Below this, a descriptive paragraph explains that a security group is a set of firewall rules. The 'Assign a security group' section has two radio buttons: 'Create a new security group' (selected) and 'Select an existing security group'. A red arrow labeled '1' points to the 'Create a new security group' option. The 'Security group name' field contains 'Web Server SG' and is highlighted with a red arrow labeled '2'. The 'Description' field contains 'launch-wizard-7 created 2016-02-03T19:49:12.288+05:30'. Below this is a table with columns: 'Type', 'Protocol', 'Port Range', and 'Source'. The table has three rows: 'SSH' (TCP, 22, My IP 52.1.77.244/32), 'HTTP' (TCP, 80, Anywhere 0.0.0.0/0), and 'HTTPS' (TCP, 443, Anywhere 0.0.0.0/0). A red arrow labeled '3' points to the 'Add Rule' button. A red arrow labeled '4' points to the 'Source' column. At the bottom right, there are three buttons: 'Cancel', 'Previous', and 'Review and Launch'. A red arrow labeled '5' points to the 'Review and Launch' button.

**Step 6: Configure Security Group**

A security group is a set of firewall rules that control the traffic for your instance. On this page, you can add rules to allow specific traffic to reach your instance. For example, if you want to set up a web server and allow Internet traffic to reach your instance, add rules that allow unrestricted access to the HTTP and HTTPS ports. You can create a new security group or select from an existing one below. [Learn more about Amazon EC2 security groups.](#)

**Assign a security group:** ☒ Create a new security group 1

☐ Select an existing security group

**Security group name:**  2

**Description:**

Type <sup>i</sup>	Protocol <sup>i</sup>	Port Range <sup>i</sup>	Source <sup>i</sup>

HTTP	TCP	80	Anywhere 0.0.0.0/0

***What is Azure?***

Azure is an open source and flexible cloud platform which helps in development, service hosting, service management, and data storage. The Azure cloud computing tool hosts web applications over the internet with the help of Microsoft data centers.

***What is Aws?***

Amazon Web Services is widely used secure cloud services platform, offering computing power, content delivery, database storage, and other functionality to help businesses scale and grow.

Government Cloud	AWS has an edge as far as government cloud offerings.	Limited reach for government cloud offerings.
Support for Hybrid cloud	Does not offers the best of hybrid cloud support.	With Hybrid Cloud, organizations can integrate onsite servers with Cloud instances.
Ecosystem	AWS has a software marketplace with an extensive partner ecosystem.	With very few Linux options, Azure doesn't have a big ecosystem.
Support for Big Data	EBS storage is ideal for handling big data.	Standard storage has many issues for big data, and therefore you need premium storage.

Maturity	More mature cloud environment for big data.	The less mature environment for big data.
Machine access	In AWS machine can be accessed separately.	Machines are grouped into cloud service and respond to the same domain name with various ports.
Salary	The average salary for "AWS engineer" is approximately \$141,757 per year for Software Architect.	The average salary for "Microsoft Azure" ranges from approximately \$113,582 per year.
Key features	Zero setups, Detail Monitoring, Auto-scaling groups.	Startup friendly, High performance, Low cost.
Long term data archiving	Allows long term data archiving and retrieval.	Does not offer any long term data archiving and retrieval option.
Security	Security is provided using defined roles with permission control feature.	Provides security by offering permissions on the whole account.

### ***Popularity Index with Market Share***

Stack Overflow Questions AWS vs. Azure

AWS continues to dominate a global cloud-infrastructure services industry which is likely to hit proximately \$70 billion last year. Today, it enjoys market share which is better than some top public cloud providers.

Google Trends Azure vs. AWS

In the past year, Azure's cloud adoption rate is almost 85 percent that of AWS', up from 70 percent last year.

### ***Advantages of AWS***

Here, are significant advantages of adopting AWS cloud services:

- Compute Cloud allows you to increase or decrease storage according to the need of your organization
- AWS enables you to select an operating system, programming language, database of your choice.
- Broad & deep service offerings
- Robust partner ecosystem
- Trusted by high-profile customers
- High Transfer Stability
- Minimal information is lost during server and storage transfer

- Offers more data centers for availability and low latency
- Better DevOps support
- Simpler licensing method
- Stronger support for BI and analytics

### ***Advantages of Azure***

Here, are some major advantages of using Azure cloud services:

- Capability for developers and users to create, maintain and deploy applications
- Fully scalable cloud computing platform offers open access across multiple languages, frameworks, and tools
- Total support for Microsoft legacy apps
- Greater awareness of enterprise needs
- Easy one-click migrations in many cases
- Conversion of on-prem licenses to the cloud
- Support for mixed Linux/Windows environments
- Offers inbuilt tool like Azure stack to help the organization deliver Azure service from the own data center

### ***Disadvantages of AWS***

Here, are few drawbacks of Amazon Web Services:

- Less hybrid- cloud-friendly
- AWS elastic load balancer is not equipped to handle as many requests as it receives
- AWS lacks customer support, so it more suitable for a technically savvy group of consumers and those companies who have their inbuilt tech support team
- The number of choices offered by AWS is confusing to those who may not speak the language of technology.
- Incompatible and Weak Hybrid Strategy

- AWS is a less open private cloud. This makes it an unpopular storage option for sensitive industries like banking
- AWS has too many products which makes the selection process much harder

### ***Disadvantages of Azure***

The major Drawbacks of Azure cloud services are:

- Customer service is not transparent, and data is hosted globally. So, if you have data restrictions where it must be stored in a specific country, at that time you need to verify/specify with Microsoft
- You will be charged extra for paying as you go
- Azure cloud-based services are full of glitches. To fix these bugs, you will need to spend additional money
- Less flexibility about non-Windows server platforms, when compared to AWS
